

What the AI SDR Dashboard adds to QuickMail

QuickMail sends the email. Our app decides who gets it, reads what comes back, and asks a person before anything important happens.

QUICKMAIL'S JOB

Sending at scale

- 17 mailboxes, rotated automatically
- Campaigns and follow-up sequences
- 50,546 prospects stored
- Open, click and bounce tracking
- An inbox where replies land

OUR APP'S JOB

Judgement and safety

- Sorts replies so you read only what matters
- Writes a suggested answer for each one
- Asks before sending or blocking anyone
- Keeps a permanent do-not-email list
- Builds a whole campaign from a brief

What QuickMail lets us control directly

FEATURE	WHAT WE CAN DO WITH IT
Create a campaign	Emails, follow-ups, timing, senders and prospects — all from our screen.
Prospect list	We keep our own copy of all 50,546, so search and blocking are instant.
Mailboxes	Spot a broken sender before a campaign tries to use it.
Results	Sent, opened, replied and bounced, for every campaign.

Four things it will *not* let us do — and how we solved each

WHAT WE NEEDED	HOW WE GOT IT	WHERE IT STANDS
Read the replies their tools give a count, not the message	Through your signed-in browser	All 375 conversations in our app, full message included.
Send a reply no way to send email at all	Through your signed-in browser	Goes from the right mailbox, in the same thread. Tested and confirmed.
Start a campaign schedule and switch-on are manual	A robot clicks the buttons	Schedule set, campaign switched on, then checked afterwards.
Stop emailing one person no do-not-contact setting	Through your signed-in browser	Blocked here, marked there, and their sequence cancelled.

In plain terms: QuickMail was built to be used by hand, not driven by another program. Where their tools stop, we use the browser you are already signed into — the same way you would click it yourself, just automatic.

What we built that QuickMail doesn't have

None of this exists in QuickMail. It is the reason the app exists.

WHAT WE ADDED	WHY IT MATTERS
Ask before acting	Sending a reply or blocking someone both stop and show you exactly what will happen. Nothing goes out on its own, and every decision is recorded.
Permanent block list	QuickMail forgets someone if the spreadsheet is imported again. Ours remembers the email address forever, so a person who asked to stop is never contacted twice.
Reply sorting	Every reply is labelled positive, neutral or negative. 375 conversations become the 138 actually worth reading — the rest are out-of-office messages.
Suggested replies	A ready-written answer for each conversation, signed by whoever owns that mailbox. You edit it or replace it before it goes.
Campaign from a brief	Describe the campaign in a sentence and the app writes the emails, the follow-ups and the schedule, then builds it in QuickMail.
Campaign start and end dates	QuickMail has no such setting. We add it by switching the emails on and off at the right time.
Checks before sending	Catches a broken sender, a missing name field, or a blocked address — each check added after a campaign quietly sent nothing.
Search inside replies	Search the words in the message, not just names. "The one who asked about pricing" is findable.

Where things stand

WORKING TODAY • Campaigns built and launched from the app • A real reply sent and confirmed • Blocking a person, verified in QuickMail • All 375 conversations available and searchable	NEEDS A DECISION • 38 people have asked us to stop and are still on the lists • No AI subscription is active — the free quota ran out • 1 in 10 emails bounces; the worst campaign is 4 in 5 • 5 of 17 mailboxes fail to attach to campaigns
--	--

One risk worth knowing. Reading replies, sending them and blocking someone all rely on QuickMail's own website working the way it does today. If they change it, those three stop working until we adjust — and they will say so clearly rather than fail quietly. Creating campaigns is unaffected.
